DATA SHEET

STK433-290-E — Thick-Film Hybrid IC 3-channel class AB audio power IC, 80W+80W+80W

Overview

The STK433-290-E is a hybrid IC designed to be used in 80W × 3ch class AB audio power amplifiers.

Applications

- Audio power amplifiers.

Features

- Pin-to-pin compatible outputs ranging from 80W to 150W.
- Can be used to replace the STK433-000/-100 series (30W to 150W × 2ch) and STK433-200(A) series (30W to 60W × 3ch) due to its pin compatibility.
- Miniature package (64.0mm × 36.6mm × 9.0mm)
- Output load impedance: $R_L = 6\Omega$ to 4Ω supported
- Allowable load shorted time: 0.3 second
- Allows the use of predesigned applications for standby and mute circuits.

Series Models

	STK433-290-E	STK433-300-E	STK433-320-E	STK433-330-E
Output 1 (10%/1kHz)	80W×3ch	100W×3ch	120W×3ch	150W×3ch
Output 2 (0.4%/20Hz to 20kHz)	50W×3ch	60W×3ch	80W×3ch	100W×3ch
Maximum rating V_{CC} max (no sig.)	±54V	±57V	±65V	±71.5V
Maximum rating V_{CC} max (6Ω)	±47V	±50V	±57V	±63V
Recommended operating V_{CC} (6Ω)	±33V	±36V	±41V	±44V
Dimensions (excluding pin height)	64.0mm×36.6mm×9.0mm			

■ Any and all SANYO Semiconductor Co.,Ltd. products described or contained herein are, with regard to "standard application", intended for the use as general electronics equipment (home appliances, AV equipment, communication device, office equipment, industrial equipment etc.). The products mentioned herein shall not be intended for use for any "special application" (medical equipment whose purpose is to sustain life, aerospace instrument, nuclear control device, burning appliances, transportation machine, traffic signal system, safety equipment etc.) that shall require extremely high level of reliability and can directly threaten human lives in case of failure or malfunction of the product or may cause harm to human bodies, nor shall they grant any guarantee thereof. If you should intend to use our products for applications outside the standard applications of our customer who is considering such use and/or outside the scope of our intended standard applications, please consult with us prior to the intended use. If there is no consultation or inquiry before the intended use, our customer shall be solely responsible for the use.

■ Specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.

STK433-290-E

Specifications

Absolute maximum ratings at $T_a=25^{\circ}\text{C}$, Unless otherwise specified $T_c=25^{\circ}\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Maximum power supply voltage	V_{CC} max (0)	Non signal	± 54	V
Maximum power supply voltage	V_{CC} max (1)	$R_L \geq 6\Omega$	± 47	V
Minimum operating supply voltage	V_{CC} min		± 10	V
#13 Operating voltage	VST OFF max		-0.3 to +5.5	V
Thermal resistance	θ_{j-c}	Per one power transistor	2.1	$^{\circ}\text{C}/\text{W}$
Junction temperature	T_j max	Should satisfy T_j max and T_c max	150	$^{\circ}\text{C}$
Operating substrate temperature	T_c max		125	$^{\circ}\text{C}$
Storage temperature	T_{stg}		-30 to +125	$^{\circ}\text{C}$
Allowable time for load short-circuit	t_s	$V_{CC}=\pm 33\text{V}$, $R_L=6\Omega$, $f=50\text{Hz}$, $P_O=50\text{W}$, 1-channel active	0.3	s

Operating Characteristics at Unless otherwise specified $T_c=25^{\circ}\text{C}$, $R_L=6\Omega$ (Non-inductive Load), $R_g=600\Omega$, $V_G=30\text{dB}$

Parameter	Symbol	Conditions *2				Ratings			unit	
		V_{CC} (V)	f (Hz)	P_O (W)	THD (%)	min	typ	max		
Output power *1	P_O (1)	± 33	20 to 20k		0.4	47	50		W	
	P_O (2)	± 33	1k		10		80			
Total harmonic distortion *1	THD (1)	± 33	20 to 20k	5.0				0.4	%	
	THD (2)	± 33	1k							0.01
Frequency characteristics *1	f_L, f_H	± 33		1.0		+0 -3dB	20 to 50k		Hz	
Input impedance	r_i	± 33	1k	1.0			55		$k\Omega$	
Output noise voltage *3	V_{NO}	± 39				$R_g=2.2k\Omega$		1.0	mVrms	
Quiescent current	I_{CCO}	± 39				No loading	30	70	120	mA
Output neutral voltage	V_N	± 39					-70	0	+70	mV
#13 Stand-by ON threshold *5	VST ON	± 33				Stand-by		0	0.6	V
#13 Stand-by OFF threshold *5	VST OFF	± 33				Operation	2.5	3.0		V

[Remarks]

- *1: For 1-channel operation
- *2: Unless otherwise specified, use a constant-voltage power supply to supply power when inspections are carried out.
- *3: The output noise voltage values shown are peak values read with a VTVM. However, an AC stabilized (50Hz) power supply should be used to minimize the influence of AC primary side flicker noise on the reading.
- *4: Use the transformer power supply circuit shown in the figure below for allowable load shorted time and output noise voltage measurement.
- *5: The impression voltage of '#13 (Stand-By) pin' must not exceed the maximum rating.
Power amplifier operate by impressing voltage +2.5 to +5.5V to '#13 (Stand-By) pin'.
- *6: Please connect -Pre V_{CC} pin (#1 pin) with the stable minimum voltage, and connect so that current does not flow in by reverse bias.
- *7: Thermal design must be implemented based on the conditions under which the customer's end products are expected to operate on the market.
- *8: The case of this Hybrid-IC is using thermosetting silicon adhesive (TSE322SX).
- *9: Weight of HIC: 24.8g
Outer carton dimensions (W×L×H): 452mm×325mm×192mm

Recommended External Components

Parts Location	Recommended value	Circuit purpose	Above Recommended value	Below Recommended value
R01, R23	100Ω/1W	Resistance for ripple filter. (Fuse resistance is recommended. Ripple filter is constituted with C03, C23.)	-	Short-through current may increase at high frequency.
R02, R03, R04	1kΩ	Resistance for input filters.	-	-
R05, R06, R07	56kΩ	Input impedance is determined.	Output neutral voltage (VN) shift. (It is referred that R05=R08, R06=R09, R07=R10)	
R08, R09, R10	56kΩ	Voltage gain (VG) is determined with R11, R12, R13	-	-
R11, R12, R13	1.8kΩ	Voltage gain (VG) is determined with R8, R9, R10. (As for VG, it is desirable to set up by R11, R12, R13.)	It may oscillate. (VG<30dB)	With especially no problem
R14, R15, R16	4.7Ω	Noise absorption resistance.	-	-
R17, R18, R19	4.7Ω/1W	Resistance for oscillation prevention.	-	-
R20, R21, R22	0.22Ω ±10%, 5W	Output emitter resistor (Metal-plate resistor is recommended.)	Decrease of maximum output Power	It may cause thermal runaway
R30	Note*5	Select restriction resistance, for the impression voltage of '#17 (Stand-By) pin' must not exceed the maximum rating.		
C01, C02	100μF/100V	Capacitor for oscillation prevention. • Locate near the HIC as much as possible. • Power supply impedance is lowered and stable operation of the IC is carried out. (Electrolytic capacitor is recommended.)	-	-
C03, C23	100μF/100V	Decoupling capacitor • The ripple ingredient mixed in an input side is removed from a power supply line. (Ripple filter is constituted with R03, R04.)	The change in the ripple ingredient mixed in an input side from a power supply line	
C04, C05, C06	2.2μF/50V	Input coupling capacitor. (for DC current prevention.)	-	
C07, C08, C09	470pF	Input filter capacitor • A high frequency noise is reduced with the filter constituted by R02, R03, R04.	-	
C10, C11, C12	3pF	Capacitor for oscillation prevention.	It may oscillate.	
C13, C14, C15	10μF/10V	Negative feedback capacitor. • The cutoff frequency of a low cycle changes. ($f_L=1/(2\pi \cdot C13 \cdot R11)$)	The voltage gain (VG) of low frequency is extended. However, the pop noise at the time of a power supply injection also becomes large.	The voltage gain (VG) of low frequency decreases.
C16, C17, C18	0.1μF	Capacitor for oscillation prevention.	It may oscillate.	
C19, C20, C21	68pF	Capacitor for oscillation prevention.	It may oscillate.	
L01, L02, L03	3μH	Coil for oscillation prevention.	With especially no problem	It may oscillate.

(*1) Capacitor mark "A" side is "-" (negative).

(*2) STK433-100Sr (2ch AMP) doesn't mount parts of ().

(*3) Add parts C23 to the other side of PCB.

(*4) Recommended standby circuit is used.

Evaluation Board Characteristics

[Thermal Design Example for STK433-290-E (R_L = 6Ω)]

The thermal resistance, θ_{c-a}, of the heat sink for total power dissipation, Pd, within the hybrid IC is determined as follows.

Condition 1: The hybrid IC substrate temperature, T_c, must not exceed 125°C.

$$P_d \times \theta_{c-a} + T_a < 125^\circ\text{C} \dots\dots\dots (1)$$

T_a: Guaranteed ambient temperature for the end product

Condition 2: The junction temperature, T_j, of each power transistor must not exceed 150°C.

$$P_d \times \theta_{c-a} + P_d/N \times \theta_{j-c} + T_a < 150^\circ\text{C} \dots\dots\dots (2)$$

N: Number of power transistors

θ_{j-c}: Thermal resistance per power transistor

However, the power dissipation, Pd, for the power transistors shall be allocated equally among the number of power transistors.

The following inequalities result from solving equations (1) and (2) for θ_{c-a}.

$$\theta_{c-a} < (125 - T_a)/P_d \dots\dots\dots (1)'$$

$$\theta_{c-a} < (150 - T_a)/P_d - \theta_{j-c}/N \dots\dots\dots (2)'$$

Values that satisfy these two inequalities at the same time represent the required heat sink thermal resistance.

When the following specifications have been stipulated, the required heat sink thermal resistance can be determined from formulas (1)' and (2)'.

- Supply voltage VCC
- Load resistance R_L
- Guaranteed ambient temperature T_a

STK433-290-E

[Example]

When the IC supply voltage, V_{CC} , is $\pm 33V$ and R_L is 6Ω , the total power dissipation, P_d , within the hybrid IC, will be a maximum of $109.7W$ at $1kHz$ for a continuous sine wave signal according to the P_d-P_O characteristics. For the music signals normally handled by audio amplifiers, a value of $1/8P_O$ max is generally used for P_d as an estimate of the power dissipation based on the type of continuous signal. (Note that the factor used may differ depending on the safety standard used.)

This is:

$$P_d \approx 85.0W \quad (\text{when } 1/8P_O \text{ max.} = 10W, P_O \text{ max.} = 80W).$$

The number of power transistors in audio amplifier block of these hybrid ICs, N , is 6, and the thermal resistance per transistor, θ_{j-c} , is $2.1^\circ C/W$. Therefore, the required heat sink thermal resistance for a guaranteed ambient temperature, T_a , of $50^\circ C$ will be as follows.

$$\begin{aligned} \text{From formula (1)'} \quad \theta_{c-a} &< (125 - 50)/85.0 \\ &< 0.88 \end{aligned}$$

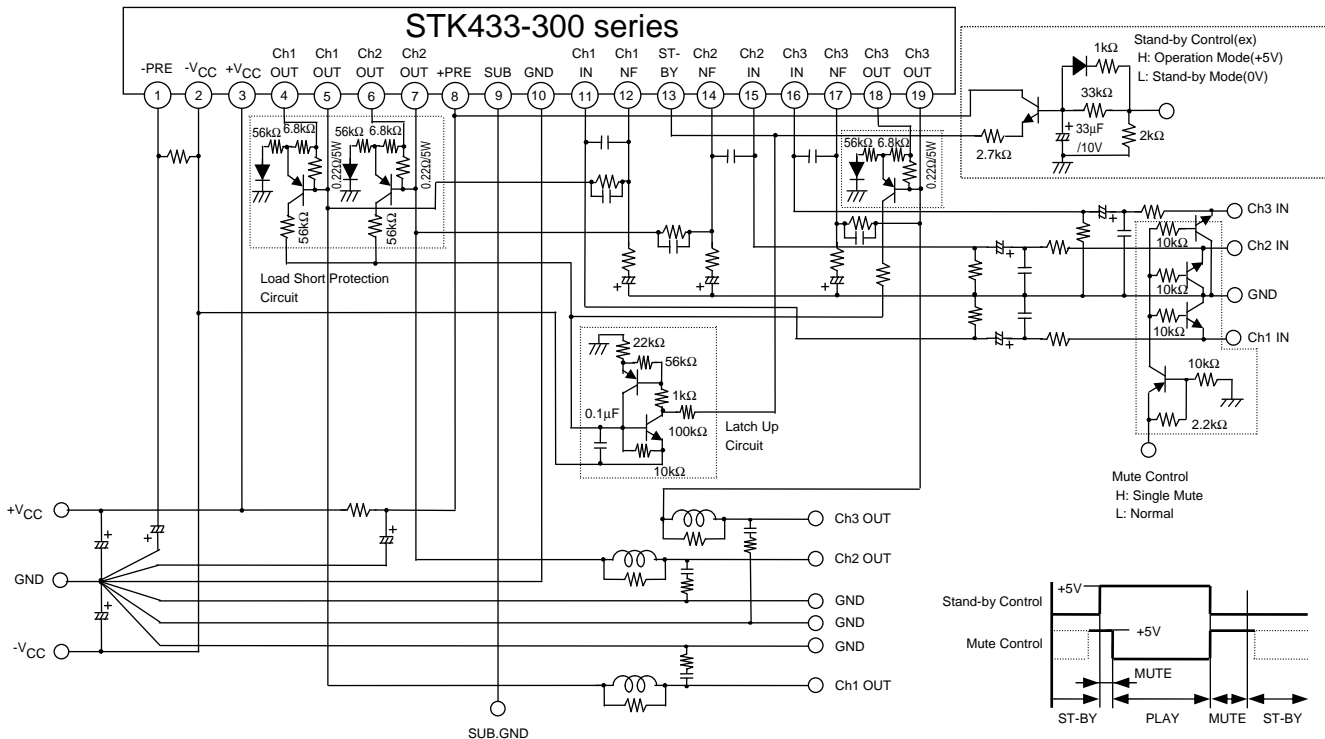

$$\begin{aligned} \text{From formula (2)'} \quad \theta_{c-a} &< (150 - 50)/85.0 - 2.1/6 \\ &< 0.82 \end{aligned}$$

Therefore, the value of $0.82^\circ C/W$, which satisfies both of these formulae, is the required thermal resistance of the heat sink.

Note that this thermal design example assumes the use of a constant-voltage power supply, and is therefore not a verified design for any particular user's end product.

STK433-300series Stand-by Control & Mute Control & Load-Short Protection Application

(*1) The impression voltage of a Stand-by terminal (#13) is the maximum rating (VST max). Please set up not to exceed.

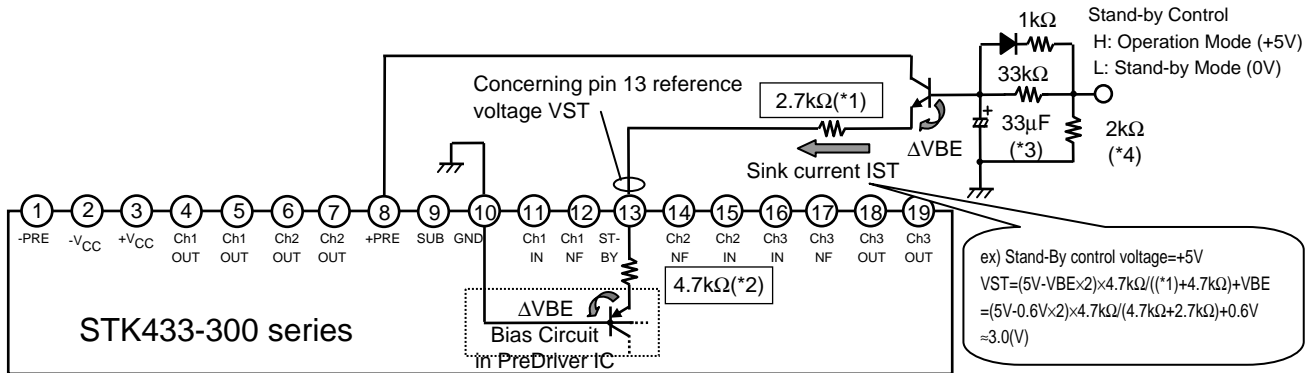

[STK433-300 series Stand-By Control Using Example]

Characteristic

- It can largely improve a pop noise to occur in power supply ON/OFF by using recommended Stand-By Control Application.
- Because It can perform Stand-By Control by regulating limit resistance to the voltage such as used microcomputers, a set design is easy.

(ex) STK433-300series test circuit. When impressed by Stand-by control control [+5V].

Operation Explanation

(1) Concerning pin 13 reference voltage VST

<1> Operation mode

The SW transistor of bias circuit is turned on at $V_{ST} \geq 2.5V$, and the amplifier becomes operation mode.

ex) $V_{ST} = 2.5V$

$$V_{ST} = (*2) \times I_{ST} + 0.6V \rightarrow 2.5V = 4.7k\Omega \times I_{ST} + 0.6V, I_{ST} \approx 0.40mA$$

<2> Standby mode

The SW transistor of Pre-driver IC is turned off at $V_{ST} \leq 0.6V$ (typ0V), and the amplifier becomes Stand-By Mode.

ex) $V_{ST} = 0.6V$

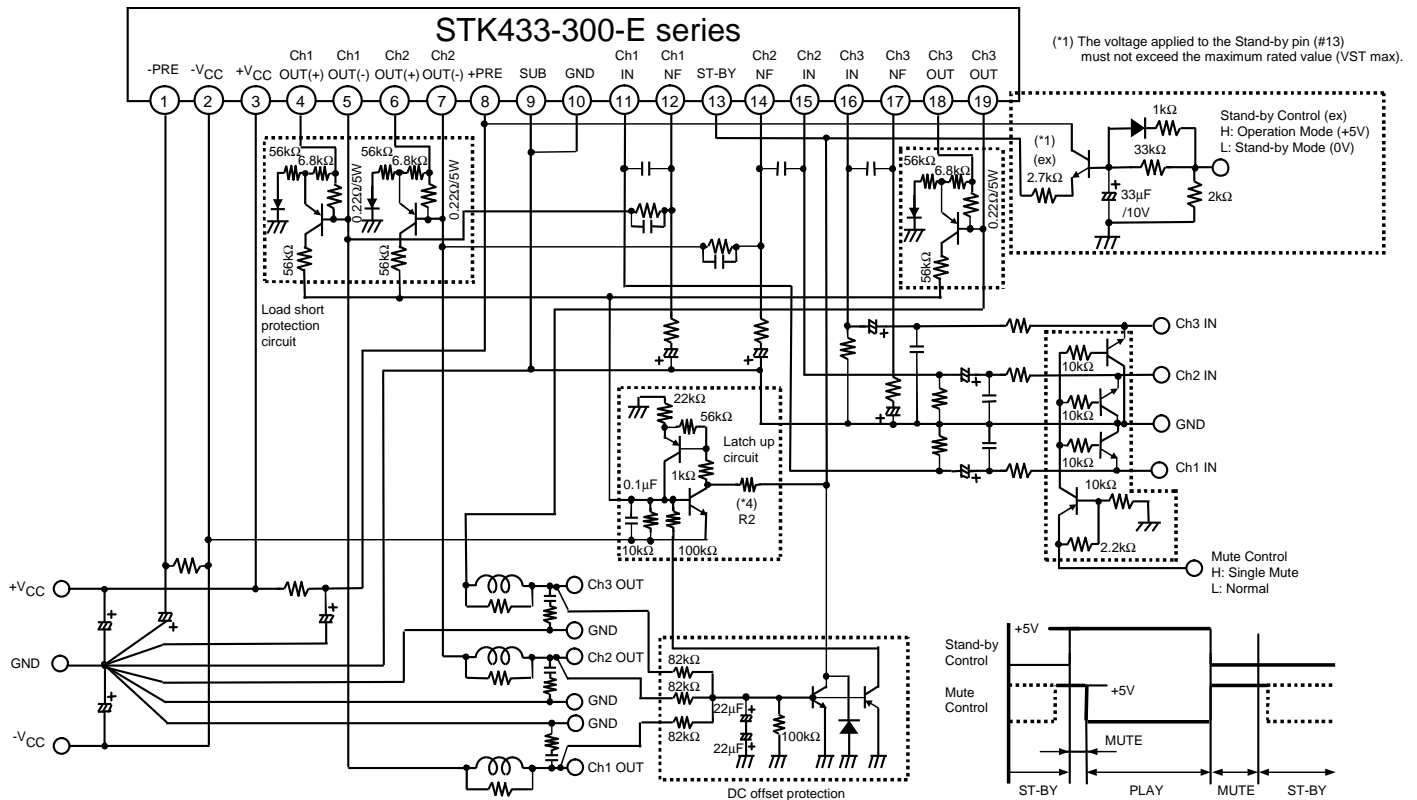

$$V_{ST} = (*2) \times I_{ST} + 0.6V \rightarrow 0.6V = 4.7k\Omega \times I_{ST} + 0.6V, I_{ST} \approx 0mA$$

(*3) It can improve a pop noise at power up time by giving a time constant of the condenser during operation.

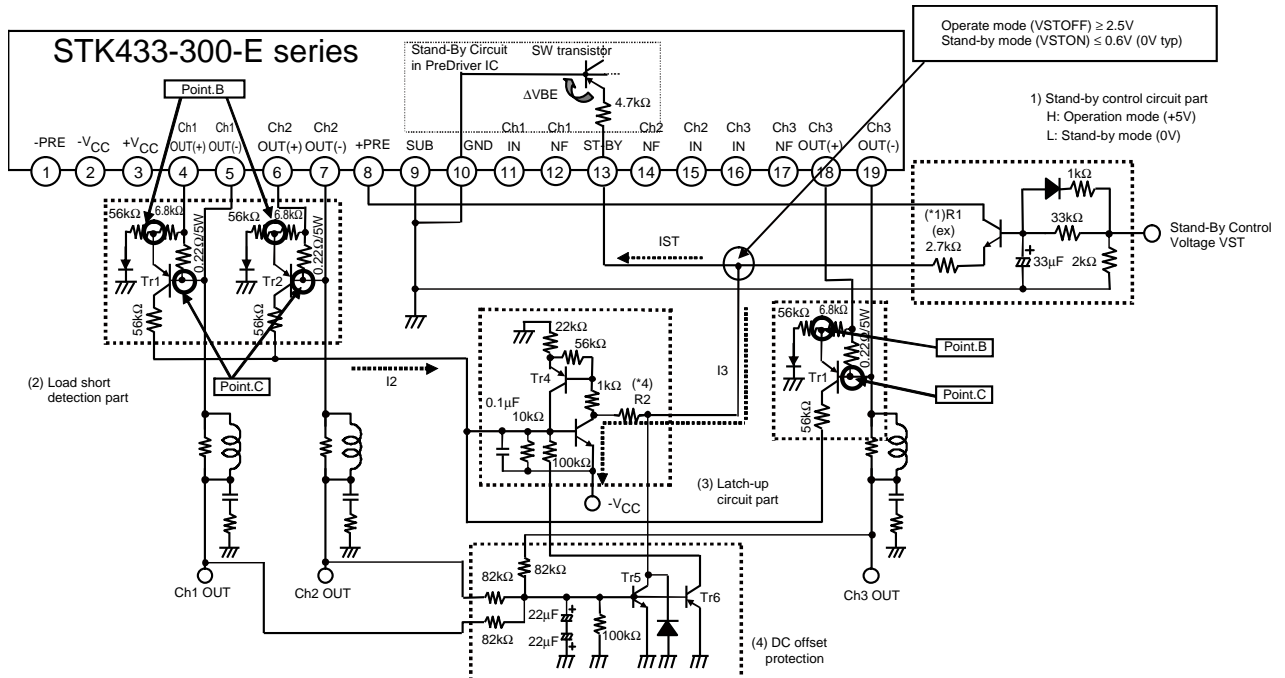

(*4) Please decide a time constant to discharge the condenser during standby.

STK433-290-E

STK433-300-E series Stand-by control, Mute control, Load-short protection & DC offset protection application

STK433-300-E Application Explanation

The protection circuit application for the STK433-300-Esr consists of the following blocks (blocks (1) to (4)).

- (1) Standby control circuit block
- (2) Load short-circuit detection block
- (3) Latch-up circuit block
- (4) DC voltage protection block

STK433-290-E

1) Stand-by control circuit block

(Reference example) STK433-300-E series test circuit (when +5V is applied to Stand-by control.)

Concerning pin 13 reference voltage VST

<1> Operation Mode

The switching transistor in the bias circuit turns on and places the amplifier into the operating mode when the voltage flowing into pin 13 (VST) becomes 0.25V or greater.

<2> Stand-By Mode

When the voltage flowing into pin 13 (VST) is stopped (=0V), the switching transistor in the bias circuit turns off, placing the amplifier into the standby mode.

(*1) The current limiting resistor (R1) must be used to ensure that the voltage flowing into the stand-by pin (pin 13) does not exceed its maximum rated value VST max.

(*2) The pop noise level when the power is turned on can be reduced by setting the time constant with a capacitor in operating mode.

(*3) Determines the time constant at which the capacitor (*2) is discharged in standby mode.

2) Load short detection block

Since the voltage between point B and point C is less than 0.6V in normal operation mode ($V_{BE} < 0.6V$) and TR1 (or TR2) is not activated, the load short-circuit detection block does not operate.

When a load short-circuit occurs, however, the voltage between point B and point C becomes larger than 0.6V, causing TR1 (or TR2) to turn on ($V_{BE} > 0.6V$), and current I2 to flow.

3) Latch-up circuit block

When I2 was supplied to latch-up circuit, TR3 operate.

VST becomes Stand-By Mode (0V) when TR3 operates (I3 flows), the power amplifier is protected.

Stand-By Mode is maintained when once TR3 operates because TR3 and TR4 compose the thyristor.

It is necessary to make the Stand-By Control voltage (*2) L (0V) once to release Stand-By mode and to make the power amplifier operate again.

After, when Stand-By Control (*2) is returned to H (ex, +5V), it operates again.

(*4) I3 is changed depending on the power-supply voltage (-VCC).

Please set resistance (R2) to become $I1 < I3$ by the following calculation types.

$$I1 \leq I3 = V_{CC}/R2$$

4) DC offset protection block

The DC offset protection circuit is activated when $\pm 0.5V$ (typ) voltage is applied to either "OUT CH1" or "OUT CH2," or "OUT CH3," and the hybrid IC is shut down (standby mode). To release the IC from the standby mode and reactivate the power amplifier, it is necessary to set the standby control voltage temporarily low (0V). Subsequently, when the standby control is returned to high (+5V, for example), the power amplifier will become active again.

The protection level must be set using the 82kΩ resistor. Furthermore, the time constant must be determined using 22μ/22μ capacitors to prevent the amplifier from malfunctioning due to the audio signal.

- SANYO Semiconductor Co.,Ltd. assumes no responsibility for equipment failures that result from using products at values that exceed, even momentarily, rated values (such as maximum ratings, operating condition ranges, or other parameters) listed in products specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein.
