## LINEAR INTEGRATED CIRCUITS

## MOTOR SPEED REGULATORS

The TCA 900 and TCA 910 are monolithic integrated circuits in Jedec TO-126 plastic package. They are designed for use as speed regulators for DC motors of record players, cassette recorders and players. The TCA 900 is particularly suitable for battery operated portable equipments, and the TCA 910 for car-battery and mains operations.

ABSOLUTE MAXIMUM RATINGS

| ABSOLUTE MAXIMUM RATINGS | TCA 900 | TCA 910 |  |
| :--- | :--- | :---: | :---: |
| $\mathrm{V}_{\mathrm{s}}$ | Supply voltage | 14 V | 20 V |
| $\mathrm{P}_{\text {tot }}$ | Total power dissipation at $\mathrm{T}_{\text {amb }}=70^{\circ} \mathrm{C}$ | 0.8 W |  |
|  | at $\mathrm{T}_{\text {case }}=100^{\circ} \mathrm{C}$ | 5 W |  |
| $\mathrm{~T}_{\text {stg }}$ | Storage temperature |  |  |
| $\mathrm{T}_{\mathrm{j}}$ | Junction temperature | -55 to $150^{\circ} \mathrm{C}$ |  |

ORDERING NUMBERS: TCA 900
TCA 910

## APPLICATION INFORMATION

The regulator supplies the motor in such a way as to keep its speed constant, independent of supply voltage, applied torque and ambient temperature variations.
The basic equation for the motor is:

$$
V_{m}=E_{0}+R_{m} I_{m}=a_{1} n+a_{2} c
$$

Where: $\quad V_{m}=$ supply voltage applied to the motor
$E_{0}=$ back electromotive force
$\mathrm{n}=$ motor speed (r.p.m.)
$R_{m}=$ internal resistance (of the motor)
$I_{m}=$ current absorbed (by the motor)
$\mathrm{a}_{1}$ and $\mathrm{a}_{2}=$ constants
c $\quad=$ drive torque
A voltage supply with the following characteristics
$\begin{array}{ll}E=E_{0} & E=\text { electromotice force } \\ R_{0}=-R_{m} & R_{0}=\text { output resistance }\end{array}$
gives performance required.

Fig. 6 - Minimum $E_{0}$ allow-
able vs. $\mathbf{R}_{\mathbf{T}}$

This means that a variation in current absorbed by the motor, due to a variation in torque applied, causes a proportional variation in regulator output voltage. In fig. 6 is shown the minimum allowable $E_{0}$ vs. $R_{T}$. The TCA 900 and TCA 910 give a reference constant voltage $\mathrm{V}_{\text {ref }}$ (between pins 2 and 3) independent of variations of $\mathrm{V}_{5}, \mathrm{I}_{2}$ and ambient temperature.
They also give: $\quad I_{3}=I_{d 3}+I_{2} / k$
Where: $\quad I_{3}=$ total current at pin 3

$$
\begin{aligned}
& \mathrm{I}_{\mathrm{d3}}=\text { quiescent current at pin } 3\left(\mathrm{I}_{2}=0\right) \\
& \mathrm{I}_{2}=\text { current at pin } 2 \\
& \mathrm{k}=\text { constant }
\end{aligned}
$$

The output voltage $\mathrm{V}_{\mathrm{m}}$, applied to the motor has the following value:

$$
V_{m}=\underbrace{V_{\text {ref }}+R_{T}\left[\frac{V_{\text {ref }}}{R_{s}}\left(1+\frac{1}{k}\right)+I_{d 3}\right]}_{\text {Term } 1}+\underbrace{\frac{I_{m}}{k} R_{T}}_{\text {Term } 2}
$$

Term 1 equals $E_{0}$ and fixes the motor speed by means of the variable resistor $R_{s}$;
Term $2 \frac{I_{m}}{k} . R_{T}$ equals the term $R_{m} \cdot I_{m}$ and, therefore, compensates variations of torque applied.
Complete compensation is achieved when:

$$
\mathrm{R}_{\mathrm{T}}=\mathrm{k} \mathrm{R}_{\mathrm{m}}
$$

$I_{f} R_{T \text { max }}>\mathrm{k}_{\mathrm{m} \text { min }}$ instability may occur.
